**Abstract:** With the world's largest population and rapid urbanization, China is in the throes of a waste management crisis. Efforts to cope with this crisis through waste incineration have been met with growing NIMBYism as the Chinese public become more environmentally aware and are determined to protect their health and economic interests. We review the turn to incineration and the major characteristics of NIMBYism and ensuing protests against waste incinerators. We then describe the May 2014 Jiufeng incinerator protest in Hangzhou and the subsequent efforts to successfully respond to NIMBYist protests and build the proposed incineration plant on the planned site. The Hangzhou Jiufeng case offers a model for breaking the logjam between development and NIMBYism, leading to important improvements in environmental governance and regulation.

**Keywords:** NIMBY, waste incineration, environmental governance, Hangzhou Jiufeng, YIMBY, environmental protests

As many Chinese cities seek to expand waste disposal facilities to cope with the increasing amount of waste, they must overcome growing public concerns and rising NIMBYism. The struggle of residents against waste disposal projects highlights both the strengths and weaknesses of Chinese environmental governance and of China's political economy. Based on our fieldwork and case monitoring beginning in 2014, we examine China's expansion of waste incineration and the accompanying challenges of NIMBYism. We suggest that the difficulties and eventual

1  
2  
3 success in constructing the Jiufeng waste incinerator in Hangzhou mark a milestone in the  
4 relationship between the state and NIMBYism and carry broader implications for waste  
5 management and the transformation of environmental governance in China.  
6  
7

8 We first provide a brief background on China's waste management crisis and the current  
9 state of Chinese waste incineration. We follow with a quick review of the theoretical framework  
10 behind the rise of NIMBY (not-in-my-backyard) activities and delineate the relationship between  
11 the state and NIMBYism in China, giving special attention to the major factors that have  
12 stimulated strong NIMBY opposition to waste incineration projects. We then focus on the  
13 milestone reached by Hangzhou's Jiufeng incinerator project and illustrate how, through the  
14 interaction of local authorities, NIMBY protesters, industry, media, and national regulatory  
15 authorities, the resolution of Jiufeng went beyond placating immediate NIMBY demands and set  
16 an example for improving environmental governance concerning waste incineration. In  
17 consequence, the experiences of Jiufeng and other projects have informed the development of  
18 national standards for emissions from waste incineration. The article concludes with a summary  
19 and argues that, in the Jiufeng and other cases, NIMBYism does not equate with parochialism  
20 and has helped to stimulate improvements in environmental governance in China.

### 32 **Waste incineration, the rise of NIMBYism, and the state**

33  
34  
35

36 With rapid urbanization, over one-third of China's 600-plus cities face serious waste disposal  
37 challenges.<sup>1</sup> The rapid municipal solid waste (MSW) growth rate can be attributed to the rise in  
38 economic prosperity and consumerism. Meanwhile, China's waste disposal capacity has not kept  
39 up with the growing amount of trash produced. As recent as the early 2000s, China's waste  
40 management plans were still primarily focused on increasing the percentage of MSW disposed  
41 through sanitary and regulated landfills and on curtailing illegal dump sites. In 2005, only 37 per  
42 cent of MSW was disposed of cleanly and of those properly disposed, over 70 per cent was by  
43 landfill.<sup>2</sup>  
44  
45  
46  
47  
48  
49

50 Caught between the rising amount of MSW and the growing difficulty of obtaining land  
51 for new landfills, the Chinese central government and municipal authorities increasingly regard  
52 waste incineration as an attractive solution for coping with the waste management crisis. Waste  
53 incineration is perceived as a more modern and environmental way of treating MSW given its  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 successful deployment in many developed countries. Through incineration, the volume of MSW  
4 can be reduced by 80 to 95 per cent, decreasing the need for landfills.<sup>3</sup> Waste incineration plants  
5 can be located closer to city where the MSW is produced, thus reducing the cost of transporting  
6 waste to landfills. When employing the best technology available, incinerators through stack  
7 emission can be odour free, minimizing potential negative impact on quality of life.<sup>4</sup> In the 13th  
8 Five-Year Plan (2016-2020), the central government raised the target incineration rate to 60 per  
9 cent for coastal cities and 50 per cent nationwide.<sup>5</sup>

10  
11  
12  
13  
14  
15 The same growth in economic prosperity that is a major cause of the waste management  
16 crisis has also brought on increasing NIMBYism and thus helped spawn a challenge for Chinese  
17 authorities used to top-down solutions. We note that unpopular waste treatment projects are  
18 often not voluntary in nature because inaction would lead literally to trash piling up and result in  
19 potentially greater negative externalities for an urban area at large. It is in this light that we must  
20 consider the positions and actions of the government and NIMBY actors who resist waste  
21 management projects such as landfills and waste incineration projects.

22  
23  
24  
25  
26  
27 We follow Kristy Michaud in underscoring the fact that NIMBYism is distinct from  
28 environmentalism. NIMBY actors are motivated by self-interest and tend to oppose specific local  
29 projects rather than all projects of a similar nature.<sup>6</sup> Michael Clary and Bruce Kraft define the  
30 'backyard' in the NIMBY concept as a contained geographic location where individuals believe  
31 that they reside close enough to an unfavourable project such that they would be personally  
32 affected by it.<sup>7</sup> Moreover Clary and Kraft see NIMBYism as arising from a combination of  
33 parochial and localized views, lack of information, distrust of those in charge, general risk  
34 aversion, and emotional reactions.<sup>8</sup> In contrast, Ian Welsh considers the implication of  
35 'backyard' in NIMBY as a physical location problematic and argues that it is not the physical  
36 space and proximity that unite the opposition but the complex ties between location and  
37 identity.<sup>9</sup>

60  
The NIMBY issue can be parsed into the strategic interactions between residents and the  
forces and interests behind the protested project. Barry Rabe and John Gilroy interpret  
NIMBYism as a form of the prisoner's dilemma game and the dominant strategy is for each  
member to 'defect from the provision of collective good'.<sup>10</sup> For the residents engaging in  
NIMBYism, the best outcome is 'unilateral defection' where the residents stop the project and  
the developers withdraw. Because potential 'hosts' are expected to not cooperate with unpopular

1  
2  
3 projects, Rabe and Gilroy conclude that the rational policy approach would be to delay public  
4 knowledge of unpopular projects.<sup>11</sup>

5  
6 From an economic perspective, Ronald Coase concludes that NIMBYism leads to an  
7 inefficient allocation of resources because of the market's failure in handling negative  
8 externality.<sup>12</sup> In order to overcome the lack of a socially optimal outcome arising from the  
9 prisoner's dilemma model, the NIMBY problem can also be considered by using the assurance  
10 game. Under this model, the best outcome is 'universal cooperation' where the end goal is the  
11 collective rather than individual welfare: citizens overcome their fear of negative externalities  
12 arising from the proposed project because they trust that the government is a moral agent  
13 representing the collective interest.<sup>13</sup>

14  
15 In addition to the above considerations, a government seeking to moderate NIMBY  
16 reactions should also consider the underlying preferences of residents. According to Peter  
17 Groothuis and Gail Miller, the major options for individuals facing a NIMBY situation are either  
18 'tolerance' (passive inaction) or 'avoidance' (vocal action), with higher-income individuals more  
19 likely to decline compensation packages and instead opt for the 'avoidance' route.<sup>14</sup> We  
20 recognize, however, that in practice the interactions between residents and project backers may  
21 be much more complicated and some residents may mix their strategies as they seek to improve  
22 their bargaining outcomes, especially compensation.

### 23 24 25 26 27 28 29 30 31 32 33 34 35 36 *NIMBYism and the state in China*

37  
38  
39 We believe these theoretical insights into the dynamics of NIMBYism are also relevant to  
40 considerations of developments in China, especially the growing number of protests against  
41 waste incineration projects. With rising economic prosperity, NIMBY activities have increased  
42 in China because individuals have also become more aware of potential health risks and seek to  
43 ward off health risks and protect their property values. Li Zhang et al. estimate that living within  
44 1 km of waste transfer stations in Shanghai is correlated with a decline of 3.8 per cent in property  
45 value.<sup>15</sup> Xiaojie Zhang et al. find through a panel study that the number of environmental  
46 complaints is positively correlated with increasing GDP per capita and education level.<sup>16</sup>

47  
48  
49 Within China's hard authoritarian political framework, the parties on opposing sides of  
50 projects operate with extra sensitivity to the broader political context. On the one hand,  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 authorities have developed a variety of tactics for managing and defusing protests, including  
4 NIMBY protests.<sup>17</sup> On the other hand, NIMBY actors take care to avoid being seen as  
5 challenging the state and are focused on securing improved terms of assistance and  
6 compensation for highly localized issues.<sup>18</sup>  
7  
8  
9

10 In this context, the national environmental regulator, a bureaucratic latecomer in its  
11 various guises has shown a willingness to work with environmental NGOs and other actors as  
12 potential allies for environmental protection. Together they have promoted gradual  
13 improvements in oversight and compliance with existing regulations by the local government. In  
14 general, as Thomas Johnson concludes, the rise of NIMBY movements in China has put pressure  
15 on the government to enforce and follow existing legislations on the review and approval of  
16 projects with potential environmental impact.<sup>19</sup>  
17  
18  
19  
20  
21

22 Local authorities in China have adopted diverse strategies to cope with growing  
23 NIMBYism. However within a culture of top-down decision-making and limited time horizons,  
24 Sarah Eaton and Genia Kostka find that local officials intent on getting projects completed have  
25 tended to consider engagement and public involvement as time-consuming, excessively  
26 cumbersome, and inefficient.<sup>20</sup> Studying the project cycles of Liulitun, Gaoantun, and Sujiatuo  
27 incinerators in Beijing, Johnson finds that local governments in the face of NIMBYism are more  
28 likely to avoid confrontation by decreasing transparency or by relocating projects to poorer areas  
29 with less informed residents.<sup>21</sup> The efforts to decrease transparency are in line with what Rabe  
30 and Gillroy have predicted.  
31  
32  
33  
34  
35  
36  
37

38 Yet, the reduced transparency is all too often accompanied by tactics of deception and  
39 manipulation and coupled with strong-arm measures leaning on a complex system of stability  
40 maintenance.<sup>22</sup> These tactics often worked. However, in this age of digital information, such  
41 tactics can only sow the seeds of distrust and provoke resistance. In a comparative study of  
42 NIMBY protests against the construction of waste transfer stations in Shanghai and Hong Kong,  
43 Sun Linlin et al. find that while both local governments did not seek public participation, the use  
44 of deception and manipulation in Shanghai increased the public's negative perception of the  
45 project and distrust of government representatives. As a result, the deceptive tactics fuelled the  
46 momentum of the NIMBY drive and undermined the government's ability to engage in  
47 constructive dialogue with NIMBY activists later in the project cycle.<sup>23</sup>  
48  
49  
50

52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Indeed, suspicion and distrust of local authorities have prompted NIMBY protesters to  
4 dig in and push harder against local authorities. NIMBY actions have succeeded in forcing local  
5 authorities to postpone or cancel the construction of high profile PX (paraxylene) projects as well  
6 as waste incineration plants in Beijing, Guangzhou, and Wujiang, among others.<sup>24</sup>  
7  
8

9  
10 Over time, some local leaders have drawn lessons from their interactions with NIMBY  
11 activists and the experiences of others. Yanwen Li et al. find that the Panyu protest in  
12 Guangdong challenged the government to go beyond traditional forms of tension reduction and  
13 to engage in collaborative governance.<sup>25</sup> Natalie Wong attributes the evolution toward broader  
14 participation in Panyu to the more open political structure and historically high rate of social  
15 activism in Guangdong.<sup>26</sup> As a result, Johnson concludes that pressure from populist  
16 environmental mobilization that started as NIMBYist helped to midwife broader changes in  
17 environmental governance in favour of more public input and participation.<sup>27</sup>  
18

25

### 26 *Sources of strong NIMBY opposition to waste incineration projects*

27  
28

29 We should underscore that we do not characterize the NIMBY actions against waste incinerators  
30 in China to be knee-jerk, emotional responses. Incineration offers many advantages as a waste  
31 disposal method. Yet the rapid growth in the number of incineration plants has faced especially  
32 strong pushback and mounting protests in China for a variety of reasons that raise public  
33 concerns. As noted earlier, local authorities and other project backers tend to be less than  
34 forthcoming about the projects. Public distrust is also warranted because regulatory oversight  
35 and management of environmental impact tend to fall short of announced standards and even to  
36 the wayside as project backers push for quick construction and operation. Such regulatory  
37 concerns have been further aggravated by financial considerations. Waste management  
38 companies, even when they are state-owned, compete fiercely with each other to win  
39 government contracts with low bids and then look for ways to cut costs, sometimes at the  
40 expense of environmental compliance. In this section, we summarize the major concerns about  
41 incineration projects that have surfaced in China.  
42  
43  
44  
45  
46  
47  
48  
49  
50

51 The public has strong cause to distrust the enforcement of existing environmental  
52 standards. By law, the building of incineration plants is required to go through environment  
53 impact assessment (EIA) prior to construction and operation. The EIA process, which is  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 criticized by many as ineffective, is especially problematic in the case of waste incineration  
4 facilities because the authorities are involved both in the building of such facilities and in  
5 environmental regulation. While public participation is required for EIAs, scandals have erupted  
6 over faked public surveys that showed overwhelming support for the incineration projects.  
7 Institutions conducting EIAs for incineration projects are viewed as untrustworthy and are  
8 thought to be on the side of municipal governments and corporations.<sup>28</sup> Often excluded from the  
9 EIA processes, the public then turn to anti-incineration protests outside of the EIA process.

10  
11  
12  
13  
14  
15 Individual incineration projects are regulated by local governments and often managed by  
16 government-affiliated entities. There thus exists significant potential for conflict of interest  
17 because the incineration plants are projects built with the full support of local governments, and  
18 there are major shared interests between the government and the incineration plant. As a result,  
19 local environmental protection bureaus, operating under the auspices of the local government,  
20 are often unwilling and unable to properly monitor and regulate the plants. Should the bureau  
21 issue stoppage orders for a heavily polluting incineration plant, the city may face an immediate  
22 trash crisis due to the sudden negative shock to its waste disposal capacity.

23  
24  
25  
26  
27  
28  
29 Moreover, extensive and costly pre- and post-incineration treatments are required for the  
30 safe incineration of waste to manage the potentially harmful by-products of incineration. Due to  
31 inadequate sorting separating wet and dry waste, incineration plants in China have difficulty  
32 burning waste with high moisture content while maintaining a desirable temperature for safe  
33 operations and power generation. Meanwhile, post-incineration treatment procedures are crucial  
34 to the protection of public safety. For each ton of MSW incinerated, some 30 kg of incinerator  
35 fly ash is produced. Fly ash contains high level of carcinogens such as dioxin and requires a  
36 costly and cumbersome treatment for safe disposal.<sup>29</sup> Yet there are reports that in practice some  
37 provinces with incinerators had no fly ash treatment plants and it was clear that some local  
38 regulators, such as the city of Wuhan, tolerated such glaring environmental violations.<sup>30</sup>

39  
40  
41  
42  
43  
44  
45  
46 Finally, a major source of frustration is the lack of transparency on the part of the local  
47 authorities in the process of approving and building new incineration plans. All too often,  
48 authorities developing incineration projects are tempted to avoid the public rather than placating  
49 public concerns with transparency. The public usually discover incineration construction plans  
50 through social networks and the online rumour mill. By taking evasive actions, local authorities  
51 tend to lose credibility with the public and thus fuel negative opinions about incineration and  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 stimulate NIMBY activities. In various cases, the incineration plants are built to operate at high  
4 standards and tend to produce low levels of pollutants. Yet due to poor information disclosure,  
5 the public tend to assume the worst.<sup>31</sup>  
6  
7

8 Frustrated by the inadequate information disclosure, NGOs have in recent years stepped  
9 in to promote information transparency of incineration facilities and regulators. They initially  
10 encountered a bleak landscape. When asked by the China Waste Information Network (backed  
11 by Wuhu Eco) in 2013, only 30 of the 122 incineration plants contacted responded with relevant  
12 data. Most of those that disclosed information provided incomplete figures. Only 10 plants  
13 provided figures for dioxin emission and only two plants provided figures for fly ash  
14 management and mercury.<sup>32</sup>  
15  
16  
17  
18  
19

20 At the time of writing, however, the situation, aided by China's quick adoption of all  
21 things digital, has improved significantly. In 2018, the Chinese Waste Information Network  
22 reached out to 152 environmental protection bureaus to request information on their regulation of  
23 waste incinerators. By June 2018, it had received responses from about 80 per cent of the  
24 contacted bureaus, and 74 per cent provided details on the scope of their regulatory work on  
25 waste incineration.<sup>33</sup>  
26  
27  
28  
29  
30

### 31 32 **The 'Jiufeng Incident': From NIMBYism to collaborative governance** 33 34 35

36 To elucidate the forces at work in waste incinerator-related NIMBY activities, we look at the  
37 case of the Jiufeng incinerator protest in Hangzhou (pop. 7 million in 2017), the provincial  
38 capital of Zhejiang Province. As we elaborate in the appendix, we began to closely follow the  
39 Jiufeng incinerator project and wrote our initial case report in summer 2014, in the context of a  
40 larger project on China's environmental governance. We visited waste incineration and other  
41 treatment facilities in China in 2014 and subsequent years, and we have tracked the Jiufeng  
42 project by using official sources and from personal interviews in Hangzhou and Beijing and by  
43 monitoring social media postings and media coverage.  
44  
45  
46  
47  
48  
49

50 The Jiufeng incinerator project brings together the conflicting forces at play: the local  
51 government that is under intense pressure to find a waste management solution, the increasingly  
52 sophisticated residents who become NIMBY actors and fight hard to protect their interests  
53 against perceived bad governance, and the national regulatory authority which seeks to find a  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 path forward for developing building incinerators in China. In our assessment, the Jiufeng  
4 NIMBY case in Zhejiang is a milestone case because of its location in Hangzhou, where Xi  
5 Jinping served as Acting Governor and then Party Secretary in 2002-7. Zhejiang has been a Xi  
6 base after he became the paramount national leader; a variety of experiences that originated in  
7 Zhejiang have subsequently been promoted as models for emulation. The resolution of the  
8 Jiufeng NIMBY case is thus of national significance.  
9

10  
11  
12  
13 In the 2000s, Hangzhou's MSW growth rate exceeded 10 per cent per year while waste  
14 disposal capacity stagnated.<sup>34</sup> To cope with the MSW surge, the Hangzhou Municipal leadership  
15 in early 2012 began planning for the construction of a waste incineration and power generation  
16 plant at the site of an abandoned quarry mine in Jiufeng Village of Zhongtai Sub-district (pop.  
17 24,244), which is part of Hangzhou's Yuhang District. In November 2013, a company, the  
18 Hangzhou Jiufeng Environmental Energy Co. Ltd, was established with the purpose of building  
19 and operating an incinerator with a processing capacity of 3,000 tons per day, the largest in  
20 Hangzhou. Most local residents in Zhongtai Township, however, would not hear about the  
21 proposed incineration plant until April 2014.  
22  
23  
24  
25  
26  
27  
28

29 On 22 April 2014, the Zhejiang Bureau of Housing and Urban–Rural Construction posted  
30 an online notice that it was reviewing the Jiufeng waste incineration and power generation  
31 project for approval and solicited public comment. The following day, Transport Radio reported  
32 that the Zhejiang Bureau of Environmental Protection had yet to receive the EIA report for the  
33 Jiufeng project. It also indicated that news of the proposed project had caused area residents to  
34 worry. An environmental volunteer was quoted as saying that the proposed site was close to  
35 major water sources and tea plantations and an estimated half a million residents live in  
36 surrounding areas.<sup>35</sup>  
37  
38  
39  
40  
41  
42

43 Worried that their concerns were ignored as had occurred with the Binjiang Incineration  
44 Plan in Hangzhou, residents around the Jiufeng Project site rallied to gather more than 20,000  
45 signatures on a petition seeking to halt the Jiufeng project and presented the signatures to the  
46 Hangzhou Planning Bureau. The petitioners were given a written reply to expect a response in  
47 due time. Meanwhile, the organizers of the April signature drive began a grass-roots education  
48 campaign and had over 100 people join them to inform residents within a 12 km radius of the  
49 proposed plant about the dangers of incineration pollutants.<sup>36</sup>  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 In the absence of an official response to the petition, some residents saw surveying  
4 equipment being moved to the proposed Jiufeng incinerator site on 8 May. They suspected that  
5 preparations were being made to start construction. As word spread by mouth, phone, and social  
6 media about this development, hundreds of residents began to gather and protest each day at the  
7 proposed project site and the local government office.  
8  
9

10  
11 Concerned that the peaceful protests might get out of control, the Yuhang District  
12 government issued a notice on 10 May that all Jiufeng project activities were to cease and that  
13 the incineration project construction would not start without completion of all mandated  
14 procedures and public support. It also promised to invite the participation of residents to  
15 guarantee their right to information and participation.<sup>37</sup> The notice failed to quell the mass anger  
16 and more than 5000 gathered to protest the following day. Protesters blocked traffic, overturned  
17 some vehicles, and scuffled with police. A number of the protesters and residents were injured  
18 and taken to the local hospital.<sup>38</sup> Even after the 10 May clash, hundreds of villagers continued to  
19 gather around the locked-down local government building. Many local cadres were against the  
20 incineration project and dozens appeared to have resigned in protest.<sup>39</sup>  
21  
22  
23  
24  
25  
26  
27  
28

29 The dramatic protests sent a powerful message to the leaders of Yuhang District and the  
30 Hangzhou municipal government that the Jiufeng project cannot be carried out without  
31 cooperation from project area residents. Jiufeng project area residents resisted the incineration  
32 plant not only because the authorities had made little effort to reach out to them as stakeholders  
33 in the proposed project. They also distrusted the project promoters and feared the project (even if  
34 they had been consulted earlier and because of what they heard about incineration plants in the  
35 greater Hangzhou area). When the authorities and incineration project promoters have such a  
36 record with local communities, how could residents be expected to trust them?  
37  
38  
39  
40  
41  
42

43 The Hangzhou leadership now recognized that they had a crisis on their hands. On 11  
44 May, Vice Mayor Xu Liyi promised that construction work on the Jiufeng project had stopped  
45 and would not restart without public approval.<sup>40</sup> Only a few days later, as if timed to respond to  
46 the Hangzhou development, the Ministry of Environmental Protection together with the quality  
47 administration issued updated and tightened guidelines for the construction and operation of  
48 waste incinerators.<sup>41</sup>  
49  
50  
51  
52

53 The Jiufeng Incident attracted national attention. While official media criticized some  
54 protesters for causing property damage, they also put blame on the local government for  
55  
56  
57  
58  
59  
60

1  
2  
3 neglecting the emotions of residents. Central state media launched a series on waste incineration  
4 and emphasized that local governments had to ensure better monitoring and public  
5 participation.<sup>42</sup> It was clear that the central authorities were keeping an eye on Hangzhou and its  
6 leadership as the Jiufeng Incident burst into the limelight.  
7  
8  
9

10 The Hangzhou leadership reached an impasse. Suspending the project bought the  
11 leadership time but not the solution for Hangzhou's growing trash problem. Relocating the  
12 project, as had happened in other cities, was also not an easy option because Hangzhou was well  
13 developed. As leaders of the provincial capital of Zhejiang, a major political base of Xi, the  
14 leaders of Hangzhou, known for pioneering various urban governance reforms, were under  
15 enormous pressure not simply to resolve the Jiufeng project issue at hand but also to find a path  
16 forward for a growing national issue in environmental governance. An increasing number of  
17 waste incinerator projects had run into similar problems. The Jiufeng project was seen as a litmus  
18 test.  
19  
20  
21  
22  
23  
24  
25

26 Clearly recognizing that they faced an uphill struggle in winning cooperation from area  
27 residents and that they could not succeed by simply continuing the top-down approach, the  
28 Hangzhou leadership, through the Yuhang District leadership, switched to partnering with the  
29 local communities while also exerting pressure on key individuals to 'maintain stability'.<sup>43</sup> On  
30 the basis of a reading of diverse sources and some interviews, we offer a summary of these  
31 partnership outreach efforts here:  
32  
33  
34  
35  
36  
37

- 38 1. Seeing is believing: It was not enough to assert that the proposed waste incinerator would be safe.  
39 Between July and September 2014, the Yuhang district government and Zhongtai neighbourhood  
40 office invited and paid for residents to make visits to existing waste incinerator facilities to see for  
41 themselves how such facilities operated and how much impact they had on the environment. To  
42 overcome the reluctance of residents, they started with the leaders of 12 villages near the project  
43 site. More than 4000 residents (2400 as of Public Notice time) went on 82 such tours. Of the four  
44 villages closest to the project site, 80 per cent of the families had at least one member join in these  
45 trips.<sup>44</sup> Altogether the visitors toured nearly 60 waste incineration facilities, including Everbright  
46 International's operations in Nanjing, Changzhou, Suzhou, Jiangyin, Jinan, and Ningbo. Some of  
47 the visitors also went out of their way to meet with residents living the facilities.  
48 Visitors on these trips learnt about multiple aspects of waste incineration, saw the incinerators in  
49 operation, and gained an understanding of the significance of such facilities for cities such as  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Hangzhou. Many came back with most of their fears allayed, and some in turn became  
4 influencers in the communities that the proposed incinerator would be reasonably clean and safe.  
5 The favourable impression many residents had of incinerators built and operated by the  
6 Everbright International Group was one factor that swayed Hangzhou to also select Everbright  
7 International to build, operate, and manage the Jiufeng project. Representatives from Everbright  
8 International became heavily involved in the project subsequently.

- 9  
10  
11  
12  
13 2. Offering compensation and benefits: The municipal and district governments pulled out all the  
14 stops to support the communities near the project site. The Hangzhou municipal government  
15 allocated Zhongtai 1000 *mu* (about 165 acres) in land-use quotas for non-agricultural  
16 development. The Yuhang district government earmarked RMB 140 million to improve the  
17 environment and infrastructure in Zhongtai: 71 of 117 planned projects were started immediately,  
18 including investments in roads, bridges, and street lights in these once isolated villages. It also  
19 promised to invest more than RMB 2 billion to help Zhongtai develop leisure/tourism, attract  
20 investments, or otherwise create job opportunities for residents.<sup>45</sup> These initiatives helped to allay  
21 fears among local community leaders that the incineration project would deter new businesses.  
22 Some community leaders saw the Jiufeng project as a welcome opportunity for much-needed  
23 development.
- 24  
25  
26  
27 3. Partnering with the communities: Over time, the Hangzhou municipal and Yuhang district  
28 governments learned to treat the local communities as partners. Following the visits to operating  
29 incinerators, a public meeting was convened to provide more details about the Jiufeng project and  
30 answer residents' questions on waste storage, incineration, emissions and the control of dioxin,  
31 and handling of fly ash.

32  
33  
34  
35  
36  
37  
38  
39  
40  
41 Going forward, project managers were careful to keep the Jiufeng area residents informed and  
42 involved.<sup>46</sup> When a geological and hydro survey was conducted in the latter half of September  
43 2014 for the EIA, area representatives were invited to observe and supervise.<sup>47</sup> Later on,  
44 monitoring equipment was set up in the villages so that residents could learn about local  
45 environmental quality first-hand. Residents were also invited to join in inspections of the  
46 incineration project and efforts were also made to mitigate construction-related pollution.

47  
48  
49  
50  
51 These efforts paid off. When, on 11 September 2014, the Zhejiang Housing and Urban-  
52 Rural Development Bureau again put the public on notice that it was considering for approval  
53 the Jiufeng project, the announcement was greeted with calm.<sup>48</sup> Those who were following the  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 project closely would note the emphasis on adhering to superior emissions standards (Euro  
4 2000), zero water discharges, and fly ash treatment, among others, as well as the fact that the  
5 project would now take up less land area (34.4 acres). The EIA was released the following day  
6 when the Hangzhou municipal government also convened a press conference to announce the  
7 proposed project details. Following surveying and other efforts, the EIA was completed in late  
8 November. A survey of the area residents was conducted and it also proved favourable. With all  
9 approvals secured, construction started on 14 April 2015 and the plant went soon into  
10 commercial operation with little public resistance. To maintain trust, the plant displays live  
11 pollutant emission data on an electronic screen visible to the public and has offered tours to the  
12 public.<sup>49</sup>

13  
14  
15 Without intending, the protesters at Jiufeng and other places have become allies of the  
16 regulatory state. The Ministry of Environmental Protection had been frustrated by the  
17 widespread incidence of corporate non-compliance with emissions standards. At the end of 2016,  
18 the Ministry, headed by Minister Chen Jining who had the full backing of President Xi to bolster  
19 environmental regulation, issued an industrial emissions compliance action plan. The action plan  
20 stipulated that firms in eight sectors, waste incineration among them, must achieve ‘obvious  
21 results’ by the end of 2017.

22  
23  
24 The Ministry strategy to force compliance from waste incineration enterprises was to  
25 demand transparency. Scholars of transparency have noted that the impact of transparency  
26 promotion tends to be ineffective and even counterproductive with only limited and partial  
27 disclosure.<sup>50</sup> In a display of its growing authority, the Ministry of Environmental Protection  
28 pushed for full disclosure and ordered all waste incineration enterprises to install equipment to  
29 automatically monitor key emissions and performance indicators, erect screens to disclose data  
30 to the public in real time, and to supply such data in real time to the environmental protection  
31 system including the Ministry in April 2017.<sup>51</sup> This corporate transparency is coupled with  
32 efforts to allow the public to visit the incineration plants so that they can see, hear, and smell for  
33 themselves. Simply put, the Ministry wants to use transparency by the waste incineration  
34 enterprises to win back public trust and enhance environmental governance of such enterprises.

35  
36  
37 The Ministry’s strategy was partly based on the experiences of projects such as Jiufeng.  
38 Even before the Jiufeng incinerator went into commercial operation, Chinese journalists began to  
39 cast the Jiufeng incinerator project as a case of successful innovation in social governance to  
40

60

1  
2  
3 untie the knot of NIMBYism.<sup>52</sup> Representatives of Everbright International eagerly touted the  
4 case as a classic public–private partnership success.<sup>53</sup> In a vote of confidence in how Hangzhou  
5 and Everbright turned the Jiufeng project around with improved governance, in July 2017 the  
6 Ministry convened in Hangzhou the corporate leaders of more than 40 waste incineration  
7 enterprises to boost the transparency initiative.<sup>54</sup> The Jiufeng project, together with two other  
8 projects in Jiangsu that were also built and operated by Everbright International, were touted as  
9 models for commendation and emulation.<sup>55</sup>

15 The Jiufeng experiences came in handy in Wuhan in summer 2019. As noted earlier,  
16 Wuhan was in the early 2000s known and criticized for the unsatisfactory performance of its  
17 waste incineration operations.<sup>56</sup> In June 2019, in a replay of Jiufeng, massive protests broke out  
18 in Wuhan’s Xinzhou District after local authorities failed to consult and involve residents in the  
19 decision to build a new incineration facility in Yangluo near residential neighbourhoods and  
20 schools. Faced with the highly publicized protests, the Xinzhou district government suspended  
21 the project and promised to seek the public’s support before re-starting the project.<sup>57</sup> On the day  
22 the project was halted, the district government began to reach out to the local population online  
23 and posted basic information regarding the benefits of waste incineration.<sup>58</sup> It also showcased  
24 pictures of clean modern incineration facilities, high-tech monitoring equipment, and happy  
25 nearby residents, and notably featured the Jiufeng incineration plant.<sup>59</sup> As of the time of this  
26 writing, it is not yet clear whether the Yangluo incinerator would go ahead but it is clear that the  
27 Xinzhou district leadership has much to learn from the Jiufeng case.

### 39 **Discussion and conclusion**

40  
41 As many cities in China struggle to cope with landfill capacity limits, they have increasingly  
42 turned to waste incineration. Yet the difficulties many cities have encountered in building  
43 incineration plants illuminate both the strengths and weaknesses of Chinese environmental  
44 governance and of China’s political economy.  
45  
46  
47

48 Municipal leaders in China have tended to rely on top–down and secretive tactics to  
49 develop waste incineration plants. Such tactics, however, undermine public distrust and prompt  
50 affected residents to engage in NIMBY activities in order to safeguard their health and the value  
51 of their property. In the meantime, since local authorities are also under pressure to maintain  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 social stability, they have found it increasingly challenging to cope with determined NIMBY  
4 activists fighting against waste incineration projects.  
5

6  
7 The case of the Jiufeng incinerator project illustrates well the dynamics of anti-  
8 incinerator NIMBYism. The Hangzhou authorities initially failed to include the public and such  
9 hubris or sheer ineptitude only served to sow distrust, fuel public anger, and stimulate NIMBY  
10 mobilization. The protesters against the Jiufeng project were primarily motivated by the  
11 perceived threat to their personal physical and economic well-being. The scope of NIMBY  
12 activities against the project, as elsewhere, was thus limited and parochial. The NIMBY activities  
13 forced the local authorities and the involved enterprise to dramatically adjust their behaviour  
14 through public engagement, increased transparency, and economic compensation. As a result,  
15 public sentiment was turned, and the Jiufeng project was completed. The significance of the  
16 Jiufeng turnaround is far from parochial, and it offers a major example of collaborative  
17 governance between government, enterprise, and the local community. By broadening public  
18 participation, enhancing transparency, and sharing both costs and benefits, the Jiufeng success  
19 turned a case of NIMBY veto into one of YIMBY (yes-in-my-backyard) development.  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 Leveraging on the experiences of Jiufeng and other projects, the Ministry of  
30 Environmental Protection was able to demand that waste incineration enterprises meet stringent  
31 requirements of transparency in complying with national standards for industrial emissions. As a  
32 result, NIMBYistic demands and more broadly local communities as stakeholders have played  
33 an important role in improving environmental standards and environmental governance. NIMBY  
34 parochialism has thus contributed to the making of civic good.  
35  
36  
37  
38

39 Faced with growing NIMBYism against the building of landfills and incinerators, waste  
40 management has figured prominently on the national agenda. In 2018, the Chinese government  
41 banned the import of waste. President Xi has personally and repeatedly stressed the importance  
42 of systematic garbage sorting and the central government has set ambitious waste sorting targets  
43 for Chinese cities to achieve by 2025.<sup>60</sup> In response, the city of Shanghai has led the nation by  
44 adopting strict garbage sorting guidelines in the summer of 2019, with emphasis on the  
45 separation of dry and wet waste, a crucial step in ensuring safe incineration and thus reducing the  
46 amount of waste going to landfill.<sup>61</sup>

## 55 **Appendix: Note on field research and interviews**

56  
57  
58  
59  
60

1  
2  
3  
4  
5 We began this research as part of a larger project on China's environmental governance in 2014.  
6 We were initially concerned with the broad issue of NIMBYism and waste disposal and  
7 conducted interviews with leading environmental NGOs (especially in Beijing and Guangzhou)  
8 and activists knowledgeable about developments in Beijing and Panyu and elsewhere, academic  
9 researchers in think tanks and universities such as Renmin University of China, China University  
10 of Political Science and Law, Beijing, Sun Yat-sen University and Tsinghua University, and  
11 journalists. We also spoke with regulators in the Ministry of Environmental Protection and  
12 visited a provincial environmental protection bureau.  
13  
14  
15  
16  
17  
18

19 We especially benefited from a site visit to Beijing's Gaoantun incinerator in the summer  
20 of 2014. The guided tour there helped us understand the as-of-then 'best case scenario' for waste  
21 incineration in China since that incinerator was used as a model for publicity. In the process, we  
22 began to learn and write about the Jiufeng protests in Hangzhou. Subsequent to 2014, we have  
23 continued to monitor the relevant developments at Hangzhou and elsewhere. One of the authors  
24 also made visits to Hangzhou and conducted interviews with individuals with knowledge of the  
25 Hangzhou situation. We have also made extensive use of public sources, including media reports  
26 and online comments/blogs. We are grateful to our interviewees, who shall remain anonymous,  
27 for their insights into general environmental issues and for helping to inform us of developments  
28 in waste incineration. Our interpretation of the public sources and of public events is shaped by  
29 the discussions we have had with our interviewees.
